1 Data quality checks of the new EUTL data used for the update of the EEA's EU ETS data viewer

1.1 Key findings

- The EUTL extract provided by the European Commission on July 1st, 2022 contained 17 830 installations-rows. The dataset used for the ETS data viewer includes 17 825 entities:
 - 16 209 stationary and 1 616 aviation operators
 - o 3 398 entities (19% of total) not operating in the third trading period
- 30 entities entered the trading system between May 2022 and July 2022.
- From 2021 on British entities are not part of the EU ETS anymore.
- Total verified emissions 2021 from stationary installations sum up to 1 335 Mt in the actual dataset (1356 Mt in 2020 / 1 253 Mt without GB).
- To align the dataset with the EU ETS registry, the information on excluded emissions provided since April 2018 has been used: For excluded entities, verified emissions and allocation have been deleted in the year of exclusion. For details see section **Error! Reference source not found.**.
- One aviation operator seems to be included twice and has been deleted (NL 202792) (section Error! Reference source not found.).
- Three installations in Malta have been deleted to allow a correct counting (see section **Error! Reference source not found.**).
- 20% of the operators report outdated activity type codes, which correspond to the second trading phase and which have been translated to new activity type codes. The resulting percentage changes in some activity type codes are still high but have been reduced compared to last year (see Error! Reference source not found.).
- 27 aviation operators changed from GB to other country codes. This results in higher verified emissions, allocations and surrendered units for these countries.

1.2 Preparation of the data

1.2.1 Data capture from Commission Excel file

The European Commission extracted data from the EUTL on July 1st, 2022 and provided this extract to the EEA (referred to as "extract for EEA" in the text). The data used for the ETS data viewer¹ is based on this extract.

It contained 17 830 installations-rows with detailed information. After joining the rows for installations from MT it ends up in **17 826 entities**.

Since April 2018, there are two additional LNG fuelled power plants^{2,3} with activity codes 20 that entered the ETS in 2017. Both use the same permit identifier MT-3 but they have different installation IDs: MT 209863 and MT 210138. It seems like the plant is included twice with two different permit identifiers. That is why the latter has been deleted since no additional information is given compared to the first, verified emissions and surrendered allowances are reported only for the first installation mentioned. Since April 2020 the installation MT 210138 was indicated as closed but was nevertheless removed from the dataset again to maintain consistency. For the same reasons the installations MT 210346 and MT 210348 were deleted as well, as they are indicated as closed but do have the same permit identifier as MT-2 and MT-1 respectively.

There is also one aircraft operator which seems to be included twice and which has been deleted (NL 202792, see section Error! Reference source not found.)

The dataset used for the ETS data viewer hence includes 17 825 entities.

1.2.2 Results of plausibility checks

No MS-IDs are doubled.

Compared to the dataset of May 2022, no installations are missing, and 30 new installations were added to EUTL. Installations located in Northern Ireland were reallocated from Great Britain in 2021.

1.2.3 Changes within the dataset

In April 2018 new columns were inserted into the extract for EEA: From 2013 onwards a column per year states if an entity was excluded from the ETS in that particular year. A reason for annual exclusion of entities can e.g. be low production / emissions or a small number of flights in the scope of the EU ETS. An entity that was excluded in one year can be part of the ETS again in following year(s).

The information on annual exclusion is not directly linked to account status. Most of the entities with closed accounts are marked as "included" which does not seem completely consistent.

Furthermore, there are entities which show ETS information (verified emissions, allocations or surrendered units) in the database provided to EEA by the Commission although these entities have been excluded in that year. In the EU ETS registry, these entities do not show verified emissions if they are excluded in a year. To harmonize the EEA data viewer with the EU ETS registry it has been decided by EEA in May 2018 to delete verified emissions and allocations of all excluded entities. Surrendered units are kept for excluded entities because these units can also be used to cover emissions from earlier years. The amount of deleted verified emissions and allocations can be seen in **Error! Reference source not found.**. Entities with an indication of zero for any ETS information have not been counted here.

Source: EUTL extract July 1st, 2022, own calculation; Entities with an indication of zero for any ETS information have not been counted here.

1.3 Comparison of the dataset provided by the Commission and the Excel file published on the Commission's website

A quick comparison between ETS data from the registry as published on the Commission's website⁴, and the extract for EEA directly provided by the Commission on May 4th, 2022 was performed but not as deeply as in April 2022.

1.3.1 Comparison of installation IDs

The July 2022 datasets shows that 18 aviation accounts were relocated from GB to other country codes compared with the May 2022 dataset.

1.4 Consistency checks within the dataset

The main findings are:

- There are 6 907 entities with a closure date. This is higher compared to the last data extract from April 2022 (6 840 entities).
- There are 313 entities with a given year of last emissions and the indication "open" in the field "account closure".

1.5 Update of the disaggregated database (installation level)

Not necessary.

1.5.2 Deletion of double installations

⁴ https://ec.europa.eu/clima/policies/ets/registry_en#tab-0-1

Due to the comparison of information on returned allowances from aviation operators for the year 2012, which has been conducted in the April 2015, it became obvious, that one aviation operator is included in the extract which is doubled (NL 202792 and 202833).

NL 202792 has a closure date in 2013 and does not include any ETS information at all but has the same operator name as NL 202833. For the latter ETS information is given including emissions in 2012. Therefore, NL 202792 has been deleted.

It appears as if three Maltese installations are double. This applies to installation MT 210138, MT 210346 and MT 210348. These all have the same Permit Identifiers with other installations, but do not have verified emissions. These installations each have the same Permit Entry Date and have the account status Closed, see chapter Error! Reference source not found..

1.5.3 Adjustment of free allowances for aviation operators for the year 2012

Free allowances for the year 2012 had to be returned by aviation operators if they chose to account for the reduced scope of the stop the clock decision.

The amount which had to be returned is publicly available on operator level. In addition, the Commission sent an excel file with details on amounts which finally had been returned and on the partial adjustment of the numbers in EUTL ("Aviation return before and after deadline.xlsx").

With information in this file, the adjustment of free allowances for 2012 takes place for the update of the EEA data viewer because it seems necessary to reflect the reduced amount of free allowances for the comparison with verified emissions.

The calculation of corrections has been conducted in April 2015.

As there have been no changes to free allocation for aviation in 2012 (see Error! Reference source not found.), no update of this correction has to be done.

1.5.4 Consistency check of surrendered units

There is no longer an inconsistency related to the sums of total ERU, CER and EUA compared with total units surrendered, as it has been revealed in the 2013 dataset.

1.5.5 Reallocation of main activity codes

New activity codes from 10-47 are in place since the start of the third trading period, but a lot of installations which already have been part of the EU ETS in the former trading periods did not change their activity codes.

In total, 3 580 installations (20% of all entities), still report old activity codes (see **Error! Reference source not found.**). These are 7 less than in the dataset of July 2021.

Table 1-3 Number of installations with old activity type codes

MAIN_ACTI VITY_TYPE _CODE	Number of installations - July 2018	Number of installations - July 2019	Number of installations - July 2020	Number of installations - July 2021	Number of installations - May 2022	Number of installations - July 2022

99						
Total	4035	3900	3761	3663	3587	3580

Source: EUTL extract July 1st, 2022 and former extracts, own calculation

Since 2015 the EU ETS data viewer no longer includes old activity codes except for code 99 which will remain as it is, if no other country specific information is available. For the installations reporting an old code, a correction will be made. Since 2015 the translation procedure follows the methodology explained in the ETC/ACM document "Attribution of new activity codes for installations with old codes in the EEA's EU ETS data viewer" (latest version as of April 2016⁵). The result of this methodology has been amended with country specific information. The translation table will be made publicly available to make the translation of activity codes as transparent as possible.

As highlighted in the methodology document, there is a risk that the number of installations allocated to activity codes 38 to 41 (Production of specific chemicals) are underestimated, because the allocation to these codes is not possible without further detailed knowledge of the activity of single installations. Consequently, there is also a risk that the number of installations allocated to activity code 42 (Production of bulk chemicals) is overestimated.

Looking at verified emissions 2021 (see Error! Reference source not found.), emissions of installations with code 42 still increased because of the allocation to new codes (from 34 to 35 Mt). But it can be considered that due to the inclusion of Member State specific information allocated verified emissions due to the translation process have decreased by a high amount of emissions: With the translation of September 2015, verified emissions of sector 42 has been 23 Mt before and 43 Mt after the translation (+20 Mt), whereas the difference has now been reduced to 1.06 Mt for the year 2021.

Similarly, it is not possible to differentiate between the production of primary (code 26) and secondary aluminium (code 27) without more information on single installations. NACE code 24.42 (Aluminium production) has now been completely translated to code 26, leading to possible overestimation and an underestimation in code 27.

In September 2015 11 installations have been translated to code 26, whereas the number of installations which was translated in July 2021 was reduced to 7 (code 26).

The installation FR 956 SK 150 and CZ 73 were relocated from code 20 to code 24 based on information from the Member States as these plants are foremost steel plants.

For further details, see Error! Reference source not found.:

http://acm.eionet.europa.eu/docs/ETCACM_EU-ETS_translation_of_activity_codes_April_2016_for_publication.pdf

Note: The total number of translations given in the table (3 580) is not the absolute number of translations, because a small amount of other translations took place in the activity type codes 20-99.

Source: EUTL extract July 1st, 2022, own calculation

The EU ETS data viewer separates between stationary installations and aviation. The total number of aviation operators (activity type code 10) is **1 616**, so there are **16 209 stationary installations** included in the data viewer.

1.5.6 Information on active installations

The indicator "Active installation in 3 TP" has been included in the EU ETS data viewer since 2015. It indicates installations and operators which operate in the third trading period. This indicator is included by the ETC/CME. If the given year of last emission is between 2005 and 2012, the indicator is "no", if the given year of last emission is higher or equal 2013 or an empty cell, the indicator is "yes".

This is to give the possibility to align the analysis of data from the EEA data viewer with the dataset published by the Commission.

1.6 Main changes in EU ETS viewer data between May 2022 and July 2022

1.6.1 Number of entities included in the scheme

The number of stationary installations and aviation operators by country is shown in the following table:

Source: EUTL extract July 1st, 2022 and former extracts, own calculation

As shown in **Error! Reference source not found.**, the July 2022 dataset includes 12 more entities than the May 2022 dataset.

1.6.2 Account closures

The indicator "account closure" is included in the dataset since May 2015. In July 2021, 10 918 entities have been indicated as open, 6 907 (39% of total) have a closure date that lies before the extraction date of the ETS dataset. All stationary installations from UK have been indicated as closed since the July 2021 dataset.

1.6.3 Active installation in 3 TP/4 TP

3 398 entities - 19% of total - indicated that they are not operating in the third/fourth trading period. This number increased by 9 compared to the dataset of May 2022.

56 of those entities no longer active in the 3rd / 4th trading period still have open accounts.

1.6.4 Verified emissions (stationary installations)

In the following table, data on verified emission is compared between the datasets from May 2022 and July 2022, just for stationary data. Differences are shown as percentages, calculated from the difference related to latest data.

Table 1-6 Changes in VE between datasets (calculated as difference May 2022 and July 2022 data / VE (July 2022))

Notes: Purple: increase, light orange: decrease, green: zero difference Source: EUTL extract July 1st, 2022 and former extracts, own calculation

There are no change in surrendered units between the datasets for trading period 1-3.

1.6.7 Free allocation from 2018 to 2021 (stationary installations)

At this point, a look into the allocations until the end of the trading period is usually taken. As the third trading period ended in 2020, the check was not carried out this time.

1.6.8 Comparison of allocated amounts under Article 10a(1), 10a(7)and 10c for the years 2013 to 2020

The comparisons of allocated amounts focussed only on those allocated under Article 10a. With the data sets from 2015 on, allocated amounts for new entrants (also called NER – new entrants reserve or just "reserve"; see Article 10a(7)) / and the transitional free allocation (10c) are separately shown by installations for the years from 2013 onwards.

 $Table \ 0\text{-}10 \ Allocated \ amounts \ for \ the \ years \ 2013 \ to \ 2021 \ for \ stationary \ installations$

1.6.9 Aviation

For aviation a comparison of verified emissions, free allocation and surrendered units has been conducted together for the years 2012-2021.

Table 0-11 Changes in VE, free allocation and surrendered units to aviation operators (2015-2021) between datasets (calculated as difference between May 2022 and July 2022 data / allowances (July 2022))

Notes: Purple: increase, light orange: decrease, green: zero difference Source: EUTL extract July 1st, 2022 and former extracts, own calculation Between the last dataset from May 2022 and the most recent dataset July 2022 significant changes can be observed for aviation operators. These changes are mostly due to the reallocation of British aviation operators to other country codes. This means all these verified emissions, allocations and surrendered units that have been mapped to GB are now mapped to other countries.

2 Aggregated database

Updated data for 2005 to 2021 on free allowances, for 2005-2021 on verified emissions and for 2005-2021 on surrendered units for all installations has been aggregated and integrated in the aggregated database.

3 Auctioning

Auctioning data has not changed qualitatively between May 2022 and July 2022. Most actual information on auctioning data is included in the background document (see on the EEA homepage below the ETS data viewer).
